

**Your Name & Project Title:**

**Summarize your pre-implementation and post-implementation findings (both process measures and key quality measures) as well as statistical analysis:**

Summarize your conclusions based on your findings:

Which Statement best describes your conclusions:

- Intervention improved both the process and the key quality variable
- Intervention did not improve the key quality variable, but it did improve the process variable
- Intervention did not improve either the process variable or key quality variable
- More data is needed to have enough power to determine if there is an impact

What is the next step based on your conclusions?

Would you recommend:

- Make your intervention permanent, and possibly expand to other areas?
- Continue to target the process you chose to impact by making improvements to your intervention or trying other interventions that can impact this process?
- Choose a different process to target next?
- Continue to collect data to evaluate the current intervention?
